Appendix V Water Framework Directive Compliance Assessment

A13.1 Introduction

A13.1.1 The Water Framework Directive

Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 Establishing a Framework for Community Action in the Field of Water Policy (European Parliament 2000) is known as the Water Framework Directive (WFD).

The WFD established a framework for the protection of both surface and groundwaters. The WFD provides a vehicle for establishing a system to improve and / or maintain the quality of waterbodies across the European Union (EU). The Directive requires all waterbodies (river, lakes, groundwater, transitional, coastal) to attain 'Good Water Status' (qualitative and quantitative) by 2027.

There are a number of WFD objectives in respect of which the quality of water is protected. The key objectives at EU level are the general protection of aquatic ecology, specific protection of unique and valuable habitats, the protection of drinking water resources, and the protection of bathing water (See Table A13.1). The objective is to achieve this through a system of river basin management planning and extensive monitoring. 'Good Status' means both 'Good Ecological Status' (GES) and 'Good Chemical Status' (GCS).

Table A13.1: WFD Environmental Objectives

Objectives
Member States shall implement the necessary measures to prevent deterioration of the status of all bodies of surface water.
Member States shall protect, enhance and restore all bodies of surface water, subject to the application of subparagraph (iii) for artificial and heavily modified bodies of water, with the aim of achieving good surface water status by 2015.
Member States shall protect and enhance all artificial and heavily modified bodies of water, with the aim of achieving good ecological potential and good surface water chemical status by 2015. Where this is not possible and subject to the criteria set out in the Directive, aim to achieve good status by 2021 or 2027.
Progressively reduce pollution from priority substances and cease or phase out emissions, discharges and losses of priority hazardous substances.
Prevent Deterioration in Status and prevent or limit input of pollutants to groundwater.

The WFD was initially transposed into Irish law by S.I. No. 722/2003 – European Communities (Water Policy) Regulations 2003, as amended (hereafter referred to as the Water Policy Regulations). The Water Policy Regulations outline the water protection and water management measures required to maintain high status of waters where it exists, prevent any deterioration in existing water status and achieve at least 'Good' status for all waters.

Subsequently, S.I. No. 272/2009 - European Communities Environmental Objectives (Surface Waters) Regulations 2009, as amended (hereafter referred to as the Surface Waters Regulations), and S.I. No. 9/2010 - European Communities Environmental Objectives (Groundwater) Regulations 2010, as amended (hereafter referred to as the Groundwater Regulations), were promulgated to regulate WFD characterisation, monitoring and status assessment programmes, in terms of assigning responsibilities for the monitoring of different water categories, determining the quality elements and undertaking the characterisation and classification assessments.

A13.1.2 Article 4.7 of the WFD

Member states must meet the conditions of the WFD unless they meet the criteria laid out in Article 4.7 of the Directive. Article 4.7 states:

Member states will not be in breach of this Directive when:

- *failure to achieve good groundwater status, good ecological status or, where relevant, good ecological potential or to prevent deterioration in the status of a body of surface water or groundwater is the result of new modifications to the physical characteristics of a surface water body or alterations to the level of bodies of groundwater, or*

- *failure to prevent deterioration from high status to good status of a body of surface water is the result of new sustainable human development activities*

and all the following conditions are met:

(a) *all practicable steps are taken to mitigate the adverse impact on the status of the body of water;*

(b) *the reasons for those modifications or alterations are specifically set out and explained in the river basin management plan required under Article 13 and the objectives are reviewed every six years;*

(c) *the reasons for those modifications or alterations are of overriding public interest and/or the benefits to the environment and to society of achieving the objectives set out in paragraph 1 are outweighed by the benefits of the new modifications or alterations to human health, to the maintenance of human safety or to sustainable development; and*

(d) *the beneficial objectives served by those modifications or alterations of the water body cannot for reasons of technical feasibility or disproportionate cost be achieved by other means, which are a significantly better environmental option.*

A13.1.3 The WFD Assessment

In order to be compliant with the requirements of the WFD, any activity which has the potential to have an impact on WFD water bodies must be assessed to determine whether it could cause deterioration in the ecological status or potential of a water body. It is, therefore, necessary to consider the possible changes associated with the Proposed Scheme.

This WFD assessment report has been prepared for the Construction and Operational Phases of the Lucan to City Centre Core Bus Corridor Scheme (hereafter referred to as Proposed Scheme) and is Appendix A13.1 of the Chapter 13 Water.

The generic environmental objectives set out below (based on Article 4.1 of the Directive) are used for the assessment of the Proposed Scheme:

- No changes affecting high status sites;
- No changes that will cause failure to meet surface water GES or GEP or result in a deterioration of surface water ecological status or potential;
- No changes which will permanently prevent or compromise the Environmental Objectives being met in other water bodies; and
- No changes that will cause failure to meet good groundwater status or result in a deterioration groundwater status.

A13.2 Overview of the Proposed Scheme

The Proposed Scheme has been split into three sections for the purposes of describing the main elements of it:

- Section 1: N4 Junction 3 to M50 Junction 7 – N4 Lucan Road;
- Section 2: M50 Junction 7 to R148 Con Colbert Road-R148 Palmerstown; and
- Section 3: R148 Con Colbert Road to City Centre – St. John's Road West.

It will commence at Junction 3 of the N4 Lucan Road / Lucan Bypass where the C-Spine route terminates before splitting to branch routes and is directed east towards the City Centre. From the R136 Ballyowen Road junction with the R835 Lucan Road the Proposed Scheme will run east down the R835 Lucan Road to the roundabout serving the Lucan Retail Park and the N4 Lucan Road eastbound slip. The Proposed Scheme will continue via the N4 (passing the Liffey Valley Shopping Centre at Junction 2) as far as the M50 Junction 7 and then via the R148 along Palmerstown bypass, Chapelizod bypass, Con Colbert Road, St John's Road West to Frank Sherwin Bridge, ending at where it will join the prevailing traffic management regime on the South Quays.

Full details of the Proposed Scheme are provided in Chapter 4 (Proposed Scheme Description) but elements of relevance to the WFD assessment are provided below.

The following activities are considered as potential sources of impact and as such are scoped into this assessment:

- Construction Phase of the Proposed Scheme;
 - Road refreshments, resurfacing or reconstruction and kerb and footpath improvements;
 - Bridge construction and widening;
 - Site clearance and limited earth works;
 - Road widening; and
 - Property boundary reinstatement.
- Operational Phase of Proposed Scheme;
 - Impermeable areas; and
 - Changes in pollutant loads.

A13.3 Methodology

A13.3.1 Study Area / WFD Screening

This WFD assessment covers only those components of the Proposed Scheme that could affect water body features. These were primarily identified as sections of the Proposed Scheme which are within 500m of surface and groundwater waterbodies (Chapter 13 Water - Study Area). The assessment looks at the impacts of new modifications to the water bodies and any changes to existing modifications.

A13.3.2 Relevant Guidelines, Policy and Legislation

A13.3.2.1 River Basin Management Plans

River Basin Management Plans (RBMPs) provide the mechanism for implementing and ensuring an integrated approach to the protection, improvement and sustainable management of the water environment and are published every six years.

The second cycle RBMP 2018 - 2021 was published by the Department of Housing, Planning and Local Government (DHPLG) in April 2018 and covers Ireland as a whole (DHPLG 2018). For the second cycle, the original (2009) Eastern, South-Eastern, South-Western, Western and Shannon River Basin Districts were merged to form one national River Basin District (RBD) which covers the whole of Ireland. For those waterbodies 'At Risk' of failing to meet the objectives of WFD, the RBMP 2018 - 2021 identified the most significant pressures impacting them as follows: agriculture (53%), hydromorphology (24%), urban wastewater (20%), forestry (16%), domestic wastewater (11%), urban runoff (9%), peat (8%), extractive industry (7%) and mines and quarries (6%).

In September 2021, the Minister for Housing, Local Government and Heritage, published the draft River Basin Management Plan for Ireland 2022-2027 for public consultation. The consultation period closed 31st March 2022. The draft RBMP sets out at the outset that it is published in the context of a rapidly changing policy landscape at European and International levels and against a backdrop of 'widespread, rapid and intensifying climate change'. In addition, Ireland is now experiencing a sustained decline in water quality following many years of improvements, and so stronger measures are now required to achieve sustainable water management in order to address and adapt to the impacts of climate change and achieve the desired outcomes for biodiversity

Image A13.1 presents the ecological status of waterbodies in Ireland over the past two cycles of the RBMP and illustrates the reduction in water quality, particularly in relation to the reduced percentage of waterbodies achieving high status and increased percentage achieving bad status. The reductions in water quality are especially notable for rivers; for other waterbodies the changes are more mixed; some reductions, some improvements. The draft RBMP cites a 4.4% net decline in the status of water bodies, and notes that this is mostly driven by a decline in the status of river water bodies.

Image A13.1: Ecological Status of Waterbodies in Ireland

The characterisation and risk assessments carried out for the third cycle show that 33% of water bodies are At Risk of not meeting their environmental objective of good or high status. Of these, 46% of impacted by a single significant pressure. Agriculture remains the most common pressure, followed by hydromorphology, forestry and urban wastewater. There has been an increase in waterbodies impacted by agriculture since the 2nd cycle RBMP.

The draft RBMP sets out a Programme of Measures (PoMs) necessary to deliver the objectives of the WFD in full and to contribute to other environmental priorities.

Until the draft RBMP has been consulted upon and finalised, the existing RBMP has been used as a reference point for this assessment with respect to proposed measures as these have yet to be agreed; however, where waterbodies' 'At Risk ' status has already been updated by the EPA online for the third cycle RBMP, this has been used in the assessment.

A13.3.3 Data Collection and Collation

The EPA's Data Explorer EPA Data Explorer, <https://gis.epa.ie/EPAMaps/> was used to assess water bodies present within the Proposed Scheme's Study Area, and includes their WFD ID numbers, designation and classification details. The WFD compliance mapping for groundwater risk and status assessment was also reviewed along with any other supporting data.

A13.3.4 Appraisal Method

In the absence of WFD assessment guidance in Ireland, the assessment has been carried out using the UK Environment Agency's 'Water Framework Directive assessment: Estuarine and Coastal waters' (Clearing the Waters for All) 2016 (updated 2017) (Environment Agency 2016). No specific guidance exists for freshwater waterbodies, however this guidance was used as the basis of the UK's Planning Inspectorate (PINS) Advisory Note 18 'Water Framework Directive' June 2017 (PINS 2017) in which it sets out the stages of an assessment. On this basis it was considered appropriate to use for the assessment of the Proposed Scheme. In line with this guidance a 2km buffer zone applied for assessing protected areas. For clarity and brevity purposes, the 2km buffer and the full list of identified protected sites (including those which are considered coastal water specific) are maintained for all assessments.

There follows a baseline assessment of the main water bodies, and a scoping assessment of the principal receptors potentially affected by the Proposed Scheme. This is followed by the impact assessment, which considers the potential impacts of an activity, identifies ways to avoid or minimise impacts, and indicates if an activity may cause deterioration or jeopardise the water body achieving GEP/GES.

There are several stages to this assessment:

- A scoping assessment of the main receptors including waterbodies, protected areas nature conservation, bathing water etc (Section A13.4);
- An assessment against quality elements including hydromorphology, biology, water quality, protected areas and invasive species (Section A13.5);
- Assessment of the Proposed Scheme against mitigation measures and a cumulative assessment against other proposed schemes (Section A13.6 and Section A13.7); and
- Assessment against other EU Directives (Section A13.8).

A13.4 Baseline scoping

A13.4.1 Water body scoping

Table A13.2 lists the WFD water bodies within the Study Area (see Section 13.3 of Chapter 13 of the EIAR for more details of these WFD surface water bodies). These are scoped into the assessment due to the location of the Proposed Scheme's works within or adjacent to them.

Table A13.2: Water body status

Water body ID	Name of water body in RBMP	Hydro-morphological designation	Current Status/Potential (2013-2018)	Objective status/potential
Groundwater				
IE_EA_G_008	Dublin	-	Good	Not at Risk
Surface water				
IE_EA_09L012100	Liffey_170	-	Good	At Risk
IE_EA_09L012350	Liffey_180	-	Moderate	At Risk
IE_EA_09L012360	Liffey_190	-	Moderate	At Risk
IE_EA_09C020500	Camac_040	-	Poor	At Risk
Transitional water				
IE_EA_090_0400	Liffey Estuary Upper	-	Good	At Risk

A13.4.2 Protected areas

The WFD requires that activities are also in compliance with other relevant legislation, as considered below. The following are looked at as part of the assessment (as mentioned above, in line with guidance a 2 km buffer zone was applied in this assessment):

- Nature conservation designations;
- Bathing waters;
- Nutrient Sensitive Areas; and
- Shellfish waters.

A13.4.2.1 Nature conservation designations

These are areas previously designated for the protection of habitats or species where maintaining or improving the status of water is important for their protection. They comprise the aquatic part of Natura2000 sites – Special Protection Areas (SPAs) designated under the Birds Directive (79/409/EEC) and Special Areas of Conservation (SACs) designated under the Habitats Directive (92/43/EEC).

Ramsar sites are wetlands of international importance designated under the Ramsar Convention (adopted in 1971 and came into force in 1975), providing a framework for the conservation and wise use of wetlands and their resources.

The EPA data (<https://gis.epa.ie/EPAMaps/>) was used to find out the nature conservation designations within 2km of the Proposed Scheme.

There are no Ramsar sites, SPAs or SACs within 2km of the Proposed Scheme.

A13.4.2.2 Bathing waters

Bathing waters are those designated under the Bathing Water Directive (76/160/EEC) or the later revised Bathing Water Directive (2006/7/EC). Bathing Water Quality Regulations were adopted in March 2008 (following a public consultation) transposing the EU Bathing Water Directive of 2006 into Irish law.

There are no bathing water sites within 2km of the Proposed Scheme.

A13.4.2.3 Nutrient sensitive areas

Nutrient sensitive areas comprise Nitrate Vulnerable Zones and polluted waters designated under the Nitrates Directive (91/676/EEC) and areas designated as sensitive areas under the Urban Waste Water Treatment Directive (UWWTD)(91/271/EEC). The UWWTD aims to protect the environment from the adverse effects of the collection, treatment and discharge of urban waste water. Sensitive areas under the UWWTD are water bodies affected by eutrophication associated with elevated nitrate concentrations and act as an indication that action is required to prevent further pollution caused by nutrients.

The River Liffey and the Liffey Estuary Upper are both designated Nutrient Sensitive areas. The Proposed Scheme is approximately 50m from the River Liffey and the Liffey Estuary. There are no other nutrient sensitive sites within 2km of the Proposed Scheme.

A13.4.2.4 Shellfish waters

The Shellfish Waters Directive (2006/113/EC) aims to protect or improve shellfish waters in order to support shellfish life and growth. It is designed to protect the aquatic habitat of bivalve and gastropod molluscs, which include oysters, mussels, cockles, scallops and clams. The Directive requires Member States to designate waters that need protection in order to support shellfish life and growth. It is implemented in Ireland by the European Communities (Quality of Shellfish Waters) Regulations 2006 (SI No 268 of 2006). The Directive also provides for the establishment of pollution reduction programmes for the designated waters.

There are no shellfish waters within 2km of the Proposed Scheme.

A13.5 Waterbody assessment against quality elements

This section details a site-specific assessment of the Proposed Scheme against quality elements for biology, physico-chemical and hydromorphological elements for the relevant water bodies.

A13.5.1 Hydromorphology

Table 13.3 provides a summary of the known existing hydromorphology risk issues for the water bodies.

Table 13.3: Hydromorphology scoping summary

WFD Assessment Questions	Dublin Groundwater IE_EA_G_008	Liffey_170	Liffey_180	Liffey_190	Camac_040	Liffey Estuary Upper
Consider if your activity could impact on the hydromorphology (for example morphology or water flow) of a water body at high status?	N/A	No. Not High status.				
Consider if your activity could significantly impact the hydromorphology of any water body?	No, it is not considered that any element of the Proposed Scheme will result in a possible exposure route to groundwater.	No. No instream works proposed. Surface water drainage flow and volume will not significantly change as a result of the Proposed Scheme.				
Consider if your activity is in a water body that is heavily modified for the same use as your activity?	N/A	No. Not a HMWB.				

This element is scoped out of the assessment. No instream works are proposed as part of the Proposed Scheme. Surface water drainage flow and volume will not significantly change as a result of the Proposed Scheme.

A13.5.2 Biology

A13.5.2.1 Habitats

Table 13.4 presents a summary of biology (habitat) considerations and associated risk issues for the works for the transitional water body.

Table 13.4: Biology scoping summary

WFD Assessment Questions	Dublin Groundwater IE_EA_G_008	Liffey_170	Liffey_180	Liffey_190	Camac_040	Liffey Estuary Upper
Is the footprint of the activity 0.5 km ² or larger?	Yes. The footprint of the Proposed Scheme within the redline boundary is 0.58 km ² .					
Is the footprint of the activity 1% or more of the water body's area?	No.	For some of these waterbodies, yes, however the section of the Proposed Scheme directly interacting with the habitats of these waterbodies or crossing these waterbodies is not.				
Is the footprint of the activity within 500 m of any higher sensitivity habitat?			No. The Proposed Scheme is primarily contained within the current road boundary, amenity grassland and hardstanding areas (see Biodiversity Chapter 12 of the EIAR for further detail on habitats).			
Is the footprint of the activity 1% or more of any lower sensitivity habitat?			No. The Proposed Scheme is primarily contained within the current road boundary, amenity grassland and hardstanding areas (see Biodiversity Chapter 12 of the EIAR for further detail on habitats).			

This receptor can be scoped out of further assessment. The footprint of the Proposed Scheme is contained primarily within the current road boundary. There are no designated sites within 2km of the Proposed Scheme. WFD Assessment primarily considers the operation of a scheme. However, for biological elements potential construction impacts are often considered as they have the potential for long-term change if a potential impact is

considered to be significant. Therefore, it is important to also note here that a Construction Environmental Management Plan (CEMP) (Appendix A5.1) and Surface Water Management Plan (SWMP) (Appendix A5.1 Appendix D) will be implemented for construction management and sediment control measures respectively. Therefore this element has been scoped out of further assessment.

A13.5.2.2 Fish

Activities occurring within an estuary or inshore environment could impact on normal fish behaviour such as movement, migration or spawning. Table 13.5 presents a summary of biology (fish) considerations and associated risk issues for the works. As at least one biology (fish) consideration indicates that a risk could be associated with the works, this receptor has been scoped into the impact assessment for the transitional water body.

Table 13.5: Biology (fish) scoping summary

WFD Assessment Questions	Liffey_170	Liffey_180	Liffey_190	Camac_040	Liffey estuary Upper
Consider if your activity is in an estuary and could affect fish in the estuary, outside the estuary but could delay or prevent fish entering it or could affect fish migrating through the estuary?	No. No instream works.				
Consider if your activity could impact on normal fish behaviour like movement, migration or spawning (for example creating a physical barrier, noise, chemical change or a change in depth or flow)?	No. No instream works, current background noise levels, surface water drainage volume and flow will not be increased. A CEMP and SWMP will be implemented.				
Consider if your activity could cause entrainment or impingement of fish?	No. No instream works, current background noise levels, surface water drainage volume and flow will not be increased.				

The risks to the receptor are due to noise from construction and operation; potential release of suspended sediment concentrations, and the creation of plumes as a result; and contaminated surface water runoff. Chapter 9 (Noise & Vibration) has determined that, with the incorporation of the various mitigation measures outlined in that chapter, there are no significant residual noise or vibration impacts during construction or operation. As above, a CEMP and SWMP will be implemented, to reduce any risk of suspended solid release. In the unlikely event of an accidental spillage, the emergency response plan will be activated, and onsite spill kits utilised. Furthermore, no instream works are proposed as part of the Proposed Scheme. The Proposed Scheme does not propose to increase the current flow or volume of surface water runoff. This element has been scoped out of this assessment

A13.5.3 Water quality

Consideration should be made regarding whether phytoplankton status and harmful algae could be affected by the works, as well as identifying the potential risks of using, releasing or disturbing chemicals. Table 13.6 presents a summary of water quality considerations and associated risk issues of the works for the water body.

Table 13.6: Water Quality scoping summary

WFD Assessment Questions	Dublin Groundwater IE_EA_G_008	Liffey_170	Liffey_180	Liffey_190	Camac_040	Liffey estuary Upper
Consider if your activity could affect water clarity, temperature, salinity, oxygen levels, nutrients or microbial patterns continuously?	No. No discharge to Groundwater.	No. Current surface water discharge levels will remain the same and some attenuation and/or treatment will be installed improving the current quality of the runoff.				

WFD Assessment Questions	Dublin Groundwater IE_EA_G_008	Liffey_170	Liffey_180	Liffey_190	Camac_040	Liffey estuary Upper
Consider if your activity is in a water body with a phytoplankton status of moderate, poor or bad?	N/A					
Consider if your activity is in a water body with a history of harmful algae?	N/A	ND (Not determined)				
If your activity uses or releases chemicals (for example through sediment disturbance or building works) consider if the chemicals are on the Environmental Quality Standards Directive (EQSD) list?	No. No discharge to Groundwater.	Yes. During construction there is potential for accidental release of chemicals which are on the EQSD list (hydrocarbons e.g.); however with the implementation of control and mitigation measures outlined in the SWMP there will be no significant impacts. No substances on the EQSD list will be released during operation.				
If your activity has a mixing zone (like a discharge pipeline or outfall) consider if the chemicals released are on the Environmental Quality Standards Directive (EQSD) list?	No. No discharge to groundwater.	No. The discharge of surface water during operation from the Proposed Scheme will not include any EQSD list substances.				
Consider if ancillary sources of discharge contribute to water quality status (e.g. UWWTP Storm Water Overflow (SWO), Combined Sewer Overflow (CSO) etc.)	No. No discharge to groundwater.	Yes. The study area is known to contain sources of known pressures including UWWTP SWOs and a number of Industrial Licensed Emissions. See Chapter 13 (Water) for further information. However, the Proposed Scheme does not include any new discharge points and will not impact the flow or volume of current surface water drainage.				

The Proposed Scheme will not increase the flow or volume of current surface water drainage. The current drainage system and release to waterbodies will remain the same. The mixing zone will remain the same. In addition, a CEMP and a SWMP will be implemented. This element is scoped out of this assessment. It is important to note that the Proposed Scheme does not propose any changes to the current flow or volume of surface water runoff.

A13.5.4 Protected areas

Consideration has been made as to whether WFD protected areas are at risk from a proposed activity. Table 13.7 presents a summary of protected area considerations and associated risk issues of the works. As the protected areas considerations indicate that a risk could be associated with the works, this receptor has been scoped into the impact assessment.

Table 13.7: Protected Areas

WFD Assessment Questions	Nature Conservation Designations	Bathing Waters	Nutrient Sensitive Areas	Shellfish Waters
Consider if your activity is within 2km of any WFD protected area?	There are no designated sites within 2km of the Proposed Scheme	There are no bathing water sites within 2km of the Proposed Scheme.	The Proposed Scheme is approximately 50m from the River Liffey and the Liffey Estuary. There are no other nutrient sensitive sites within 2km of the Proposed Scheme.	There are no shellfish waters within 2km of the Proposed Scheme.

The only protected areas identified in this WFD Assessment pertaining to the Proposed Scheme are the Nutrient Sensitive Areas. The Proposed Scheme will not contribute to the nutrient loads in the Nutrient Sensitive Area. There is therefore no risk to this Protected Area and it is scoped out of the assessment.

A13.5.5 Invasive Species (IS)

Consideration should be made regarding whether there is a risk the activity could introduce or spread IS. Risks of introducing or spreading IS include materials or equipment that have come from, had use in or travelled through other water bodies, as well as activities that help spread existing IS, either within the immediate water body or other water bodies. Table A13.8 presents a summary of IS considerations and associated risk issues of the works.

Table A13.8 IS Considerations

WFD Assessment Questions	Tolka Estuary	Dublin Groundwater	Santry_020	Mayne_010
Introduction or spread of IS	No. An Invasive Species Management Plan (ISMP) (Appendix 5.1 Appendix C) has been prepared and appended to the CEMP. It will be implemented for the Proposed Scheme.			

The ISMP will be implemented for the Proposed Scheme which will contain site-specific recommendations and identifications for IS. Therefore this element has been scoped out of the assessment.

A13.5.6 Assessment Summary

The site-specific impacts of the Proposed Scheme on the biological, physico-chemical and hydromorphological quality elements of the water bodies are shown in the assessment above and summarised in Table 13.9.

Table 13.9: Assessment Summary

Receptor	Potential risk to receptor?	Note the risk issue(s) for impact assessment
Hydromorphology	No	No instream works are proposed as part of the Proposed Scheme. Surface water drainage flow and volume will not significantly change as a result of the Proposed Scheme.
Biology: habitats	No	The footprint of the Proposed Scheme is contained primarily within the current road boundary. There are no designated sites within 2km of the Proposed Scheme. In addition, a CEMP and a SWMP will be implemented.
Biology: fish	No	The risks to the receptor are due to noise from construction and operation of the proposed Scheme, and also potential release of suspended sediment concentrations and the creation of plumes as a result. Due to the current background noise levels, possible impacts to fish species are not considered to be significant. No instream works are proposed as part of the Proposed Scheme. Surface water drainage flow and volume will not increase as a result of the Proposed Scheme.
Water quality	No	The Proposed Scheme will not increase the flow or volume of current surface water drainage. The current drainage system and release to waterbodies will remain the same. The mixing zone will remain the same. In addition, a CEMP and a SWMP will be implemented. This element is scoped out of this assessment.
Protected areas	No	The Proposed Scheme is adjacent to the River Liffey and the Liffey Estuary Nutrient sensitive area. No other protected areas are within the study area of this assessment. A CEMP and SWMP will be implemented as part of the Proposed Scheme. The operation of the Proposed Scheme will not significantly change the current level of surface water volume or flow.
Invasive species	No	An Invasive Species Management Plan (ISMP) (Appendix 5.1 Appendix C) has been prepared and appended to the CEMP. It will be implemented for the Proposed Scheme

A13.6 Assessment of the Proposed Scheme against mitigation measures

Within each RBMP, there is a list of mitigation measures, or environmental improvements, which have been identified by the RBMP, which need to be implemented to improve the ecology of water bodies by a specified date for Ireland to meet the target date set by the Water Framework Directive. Part of the WFD compliance assessment is to consider mitigation measures and assess whether a proposed Scheme can contribute to them or might obstruct any of them from being delivered. None of the water bodies in the Study Area is identified within the RBMP Areas for Action.

A13.7 Cumulative assessment

The Proposed Scheme has been assessed for the potential for cumulative impacts with other Proposed Developments within 500m of the Study Area (Chapter 21 (Cumulative Impacts & Environmental Interactions)). This concludes that in combination with other Proposed Developments the Proposed Scheme will not compromise the achievement of the objectives of the WFD for any water body.

A13.8 Assessment of the Proposed Scheme against WFD objectives and other EU directives

Taking into consideration the anticipated impacts of the Proposed Scheme on the biological, physico-chemical and hydromorphological quality elements, following the implementation of design and mitigation measures, it is concluded that it will not compromise progress towards achieving GES or cause a deterioration of the overall GEP of any of the water bodies that are in scope (Table A13.10).

Table A13.10 Compliance of the Proposed Scheme with the Environmental Objectives of the WFD

Environmental Objective	Proposed Scheme	Compliance with the WFD Directive
No changes affecting high status sites	No waterbodies identified as high status	Yes
No changes that will cause failure to meet surface water GES or GEP or result in a deterioration of surface water GES or GEP	After consideration as part of the detailed compliance assessment, the Proposed Scheme will not cause deterioration in the status of the water bodies during construction following the implementation of mitigation measures; during operation, no significant impacts are predicted.	Yes
No changes which will permanently prevent or compromise the Environmental Objectives being met in other water bodies	The Proposed Scheme will not cause a permanent exclusion or compromise achieving the WFD objectives in any other bodies of water within the River Basin District.	Yes
No changes that will cause failure to meet good groundwater status or result in a deterioration groundwater status.	The Proposed Scheme will not cause deterioration in the status of the of the groundwater bodies.	Yes

The WFD also requires consideration of how a new scheme might impact on other water bodies and other EU legislation. This is covered in Articles 4.8 and 4.9 of the WFD.

Article 4.8 states: ‘a Member State shall ensure that the application does not permanently exclude or compromise the achievement of the objectives of this Directive in other bodies of water within the same river basin district and is consistent with the implementation of other Community environmental legislation’.

All water bodies within the Study Area have been assessed for direct impacts; indirect impacts on Mayne Estuary have also been assessed. The Proposed Scheme will not compromise the achievement of the objectives of the WFD for any water body. In addition, the Proposed Scheme has been assessed for the potential for cumulative impacts with other Proposed Developments within 1km of the Study Area. This concludes that in combination with other Proposed Developments the Proposed Scheme will not compromise the achievement of the objectives of the WFD for any water body. Therefore, the Proposed Scheme complies with Article 4.8.

Article 4.9 of the WFD requires that “Member States shall ensure that the application of the new provisions guarantees at least the same level of protection as the existing Community legislation”.

The Habitats Directive (1992) promotes the maintenance of biodiversity by requiring Member States to take measures to maintain or restore natural habitats and wild species listed on the Annexes to the Directive at a favourable conservation status, introducing robust protection for those habitats and species of European importance. There are European designated sites in the vicinity of the Proposed Scheme which have been assessed and are presented in the Natura Impact Statement (NIS). The NIS is a standalone document included in the planning application for the Proposed Scheme. It concludes that the Proposed Scheme will not lead to a

deterioration in the features of any designated site. The Proposed Scheme is not considered to be a risk to designated habitats and therefore is compliant with the Habitats Directive.

The Nitrates Directive (1991) aims to protect water quality by preventing nitrates from agricultural sources polluting ground and surface waters and by promoting the use of good farming practices. The Proposed Scheme will not influence or moderate agricultural land use or land management.

The revised Bathing Water Directive (rBWD) (2006/7/EC) was adopted in 2006, updating the microbiological and physico-chemical standards set by the original Bathing Water Directive (BWD) (76/160/EEC) and the process used to measure/monitor water quality at identified bathing waters. The rBWD focuses on fewer microbiological indicators, whilst setting higher standards, compared to those of the BWD. Bathing waters under the rBWD are classified as excellent, good, sufficient or poor according to the levels of certain types of bacteria (intestinal enterococci and *Escherichia coli*) in samples obtained during the bathing season (May to September). The Proposed Scheme will not impact any designated bathing waters as there is none <2km from the Proposed Scheme. It is therefore compliant with the Bathing Water Directive.

A13.9 Conclusion

Considering all requirements for compliance with the WFD, the Proposed Scheme will not cause a deterioration in status in any water body, not prevent it from achieving GES or GEP; there are no cumulative impacts with other Schemes; and it complies with other environmental legislation.

It can be concluded that the Proposed Scheme complies with all requirements of the WFD.

Taking into consideration the impacts of the Proposed Scheme on the biological, physico-chemical and hydromorphological quality elements, it is concluded that following the implementation of design and mitigation measures, it is concluded that it will not compromise progress towards achieving GES or GEP or cause a deterioration of the overall status of the water bodies that are in scope; it will not compromise the qualifying features of protected areas and is compliant with other relevant Directives. It can therefore be concluded that the Proposed Scheme is fully compliant with WFD and therefore does not require assessment under Article 4.7 of the WFD (see Section A13.1.2).
